# ACKNOWLEDGMENTS

Our thanks to all persons and institutions who have contributed information, suggestions and other support for preparing this study. The SPI Amazon 2018 is a product of the collaboration provided by the #Progresso Social Brasil network, led by Glaucia Barros.

We appreciate the collaboration of our Imazon colleagues, especially Cintya Gonçalves and Luiza Bandeira, who helped with the collection, revision and organization of data, and Stefânia Costa who prepared the graphic project of the covers of this executive summary and the scorecards.

We also acknowledge the technical reviewers of this publication, especially Glaucia Barros (Avina) and Alexandre Mansur (Imazon consultant). Finally, we thank the valuable support of author and researcher Danielle Celentano (scholarship student with the Graduate Program in Agroecology at the State University of Maranhão - Uema) in the conception and analysis of the IPS Amazônia 2018. This study received financial support from the Instituto Ibirapitanga.

# INTRODUCTION

The Social Progress Index – SPI (Índice de Progresso Social – SPI in Portuguese) in a holistic manner measures the social and environmental progress of territories (countries, states, municipalities, districts, etc.). That index is the result of a partnership between academics at major research institutes such as the Massachusetts Institute of Technology (MIT), Harvard University (United States) and University of Oxford (United Kingdom). Various countries and subnational territories around the world have been adopting it. The SPI was conceived based on the understanding that development measures are insufficient when based only on economic indicators since economic growth without social progress results in environmental degradation, exclusion and social conflicts.

The SPI offers a different approach in the area by emphasizing results (outcomes) instead of investments (inputs). One should note that the low emphasis on results brings about institutional fragmentation and a variety of viewpoints (often with a strong ideological bias) that prove to be resistant to efforts, mediation and evaluation. Furthermore, the SPI is a robust method with the capacity of integrating a broad range of indicators and presenting them in a didactic manner, spatially distributed and comparable. In that way, it is possible to inform efforts by society, the government and private sector to enhance social progress.

The IPS Amazônia, originally published in 2014 under Imazon leadership<sup>[1]</sup>, presented a detailed X-ray of the social and environmental status of all 772 Amazon municipalities for that year. It was the first state and municipal levels initiative done in the world. In fact, the institute developed an adaptation of the global scale SPI (countries) for the subnational scale. Other states, counties, districts and cities are adopting the SPI at the European Union, the United States, countries of Central America, Asia and Africa.

The SPI is made up of exclusively social and environmental indicators aggregated into three dimensions (Basic Human Needs, Foundations of Wellbeing and Opportunities) and 12 components. To that end, public data made available by governmental institutions or organized civil society make up the SPI. Since 2014, Imazon has worked with the #Progresso Social Brasil network and the Social Progress Imperative in preparing and disseminating the SPI in the Brazilian Amazon<sup>[2]</sup>, referred to throughout this report only as the Amazon (Amazônia). Thus, as a first initiative, IPS Amazônia 2018 is also a product of this partnership and is available at the [www.imazon.org.br](http://www.imazon.org.br) and [www.progressosocial.org.br](http://www.progressosocial.org.br) sites. Furthermore, the data and results broken down at a municipal level are available at [www.ipsamazonia.org.br](http://www.ipsamazonia.org.br). The IPS Amazônia 2018 reveals that there has been a slight reduction in the index compared to IPS Amazônia 2014: from 57.31 to 56.52. Overall, the Amazon region still faces numerous social and environmental problems, including worsening public safety, precarious basic sanitation and access to treated water, deficiencies in higher education, little guarantee for individual rights and the recent increase in deforestation. Other results:

- The IPS Amazônia 2018 (56.52) continues to be well below the general average of the SPI Brasil 2018 (67.18).
- Of the 12 components of IPS Amazônia, five worsened from 2014 to 2018 (*environmental quality, health and wellbeing, personal safety, tolerance and inclusion and individual rights*). For the same period, three components remained identical and four presented improvements (*nutrition and basic medical care, access to information and communication, access to basic knowledge and individual freedom and choice*).

1 <https://imazon.org.br/en/publicacoes/social-progress-index-for-the-brazilian-amazon-ips-amazonia-2014-executive-summary/>

2 The Brazilian Amazon (Amazônia Legal) occupies 59% of Brazilian territory (5 million square kilometers) and is made up of nine states (Acre-AC, Amazonas-AM, Amapá-AP, Maranhão-MA, Mato Grosso-MT, Pará-PA, Rondônia-RO, Roraima-RR and Tocantins-TO) and 772 municipalities (IBGE, 2017; IBGE, 2015). The region has 27.5 million inhabitants, who represent 13.2% of the Brazilian population (IBGE, 2018a). The region harbors one of the largest ethnic and cultural diversities in the world totaling more than 170 indigenous peoples with a population estimated at around 400 thousand persons (IBGE, 2010). Although the region has a small share of the national economy, with only 8.6% of the Gross Domestic Product (GDP) for Brazil (IBGE, 2018b), its wealth in natural resources, environmental services and biodiversity is incalculable.

# INTRODUCTION

- The average rate for the *personal safety* component worsened in the Amazon from 2014 to 2018, dropping from 54.71 to 52.28. That is due to the significant rise in the homicide rate for the region.
- Most of the municipalities (59%) had a reduction in the IPS Amazônia 2018 compared to the 2014 scores. Among the ones that reduced their indexes are the following: Parintins (AM), Itaituba (PA), São Félix do Xingu (PA), Altamira (PA), Belém (PA), Manaus (AM), Canaã dos Carajás (PA), Boa Vista (RR), Porto Velho (RO) and Imperatriz (MA).
- Only 30% of the municipalities had an increase in the SPI, among them are Tailândia (PA), Bacabal (MA), Parauapebas (PA), Terra Santa (PA) and Faro (PA).
- In 11% of municipalities, the SPI remained stable as was the case with Ourém (PA), Novo Progresso (PA), Paranatinga (MT), Coari (AM), Planalto da Serra (MT) and Centro Novo do Maranhão (MA).
- Among the Amazon states, Mato Grosso (59.13), Rondônia (58.51) and Tocantins (57.44) presented the best results in IPS Amazônia 2018, although none of the nine states surpassed the national average. There was a small improvement in the SPI from 2014 to 2018 in Acre (54.18), Maranhão (55.02), Pará (55.57) and Roraima (54.84).
- The Amazon municipalities are classified into five groups according to their results in the IPS Amazônia 2018. In the first group, 25 of them possess the best indicators (average SPI of 64.64). Some capitals are in this group: Cuiabá (MT), Palmas (TO), Belém (PA) and São Luís (MA). Although they present the best results, all the municipalities in this group, except Cuiabá, performed lower than the Brazilian average.
- The second group has 159 municipalities with an average SPI of 60.96. The state capitals Macapá (AP), Rio Branco (AC) and Porto Velho (RO) are in that group.
- The third group encompasses 281 municipalities with an average SPI of 57.31. That group includes Marabá (PA), Ariquemes (RO), Juruena (MT) and Imperatriz (MA).
- In the fourth group are 250 municipalities with critical levels of social progress with an average SPI of only 53.58. Among them are Novo Progresso (PA), Coari (AM) and Altamira (PA).
- Finally, the fifth group corresponds to the 57 municipalities with the lowest levels of social progress in the Amazon: Their indexes have an average equal to 49.63. The worst ones are Jordão (AC), Lábrea (AM) and Bom Jesus do Araguaia (MT).
- There is a positive correlation between per capita income and SPI. However, economic performance alone is not sufficient for explaining the social progress of a municipality, because the relation between the two is not linear. Some municipalities with very low per capita income present a relatively high SPIs in relation to other ones in the same income bracket. For example, Ipueiras (TO), Porto Rico do Maranhão (MA) and Santa Cruz do Arari

# INTRODUCTION

(PA) had among the 40 best indexes in the regional ranking, even though they presented a rather low per capita income in comparison to the capitals.

- On the other hand, several municipalities with income above the regional average presented some of the lowest SPI levels in 2018. For example, Campos de Júlio (MT) had the best per capita

income in the Amazon but was ranked only 231st in the SPI in 2018.

- There is no correlation between deforestation and social progress measured by the SPI. On the contrary, deforestation results in social, environmental and economic damages to the municipalities.

The IPS Amazônia 2018 summarizes a broad range of indicators and presents a detailed profile of each one of the Amazon municipalities. That enables civil society, leaders in the private sector, opinion leaders, researchers and public leaders (municipal, state and federal) to guide their actions and investments using a broad diagnosis of Amazon municipalities and states. For the 2018 edition, we updated 25 of the 43 indicators utilized in the IPS Amazônia 2014.

# CAVEATS

As the IPS Amazônia 2014, the 2018 version applies an analyze of the 772 Amazonian municipalities. Some characteristics such as the size of their territories (for example, Altamira is the largest municipality in the world in terms of land area), the long distance between the rural areas and headquarters, the presence of isolated communities, indigenous peoples and quilombolas can generate differences in terms of social performance. Consequently, a prominent variation in the quality of life and social wellbeing between them can occur. Unfortunately, since the secondary indicators are not available and sufficient for analysis, it is not possible to generate the IPS Amazônia with secondary data at a submunicipal scale.

Likewise, there are considerable differences between rural and urban zones for the majority of indicators, and, it is generally not possible to tease out the analysis of those geographical divisions, because they account for the entire municipal population.

However, some SPI indicators consider that disparity, such as environmental sanitation. In those cases, a specific SPI for those rural populations or communities may be prepared using research in primary data that respond to the principles and structure of the index. A clear example of that was the study done about the SPI for communities in the municipality of Carauari (AM) in 2015<sup>[3]</sup>. It should also be noted that municipal indicators do not necessarily reflect the situation of indigenous peoples and traditional populations that live in the Amazon region. The concept of social progress for

those peoples is differentiated due to their way of life. Even so, the indigenous peoples are present in the SPI calculation for the components *environmental quality* (Protected Areas) and *tolerance and inclusion* (violence against indigenous persons).

The maps that demonstrate the results of IPS Amazônia 2018 (dimensions and components for the municipalities) follow the same classification utilized in the 2014 report, that being the Natural Breaks classification method that allowed them to be prepared based on colors. We again note that those maps do not necessarily reflect the situation of traditional peoples and communities isolated in terms of municipal seats. Large territorial extension municipalities have relatively small populations in the Amazon, while the capitals and mid-sized cities have greater demographic density.

The Amazon also has municipalities covered by cerrado vegetation, which have a distinct social and economic dynamic compared to forest areas. The Cerrado biome occupies part of Maranhão, approximately half of the Mato Grosso and the Tocantins states. It is not possible to extrapolate the development performance of municipalities in Cerrado to the ones in forested areas of the Amazon Biome.

Finally, the IPS Amazônia 2018 also utilized 18 indicators taken from the IBGE 2010 Demographic Census. Three components have only indicators from that source: *water and sanitation*, *shelter* and *access to higher education*. Thus, they have the same performance as the IPS Amazônia 2014.

---

# WHY IS IT IMPORTANT TO MEASURE THE SOCIAL PROGRESS IN THE AMAZON?

Despite all the natural wealth of the Amazon, its population made up of around 27.5 million persons (IBGE, 2018a), live with a low quality of life, expressed in social and economic indicators that are lower than those in the rest of Brazil. That is because the model for development in the region consists of the predatory use of natural resources, illegal deforestation (Figure 1), social conflicts and economic underdevelopment. Furthermore, the Amazon suffers from an insufficient presence of public services, especially in the rural zone, and precarious infrastructure.

Unlike other indexes that measure social performance in the region, such as the Human Development Index (HDI), the SPI is obtained only from social and environmental indicators. That makes it better to evaluate the results obtained in social progress and only then compare them to economic indicators.

Additionally, the higher frequency of updates with the IPS Amazônia contributes toward capturing the rapid dynamic of transformations in the region, including the social impacts of major projects, works and public and private investments.

**Figure 1.** The Amazon: territories, deforestation and biomes (forests and non-forests).

# ABOUT THE SOCIAL PROGRESS INDEX IN THE AMAZON

The Social Progress Imperative defines social progress as the “capacity of society to satisfy the basic human needs, establish the structures that guarantee the quality of life to citizens and give opportunities so that all individuals can achieve their maximum potential” (Social Progress Imperative, 2014).

The SPI is a comprehensive and innovative method for measuring social performance at all levels of society (from the community to global scale) with the use of exclusively social and environmental

indicators. Public and transparent data provide a precise diagnosis of the social progress of territories, aiding decision-makers in the choice of better public policies and investments. It also enables comparisons of performance between municipalities within the same income bracket and, mainly, assess if they have been capable of transforming economic development into better social results (Social Progress Imperative, 2018). The SPI possesses four principles (Social Progress Imperative, 2018a):

## The SPI Principles

- 1. Exclusively social and environmental indicators:** our aim is to measure social progress directly, rather than utilize economic proxies or outcomes. By excluding economic indicators, we can, for the first time, rigorously and systematically analyze the relationship between economic development (measure for example by income or GDP per capita) and social development. Prior efforts to move “beyond GDP” have comingled social and economic indicators, making it difficult to disentangle cause and effect.
- 2. Outcomes not inputs:** our purpose is to measure the outcomes that matter to the lives of real people, not the inputs. For example, we want to measure a country’s health and wellness achieved, not how much effort is expended nor how much the country spends on healthcare.
- 3. Holistic and relevant to everybody:** we strive to create a holistic measure of social progress that encompasses the many aspects of the health of societies. Most previous efforts have focused on the poorest countries, for understandable reasons. But knowing what constitutes a successful society for any territory, including high-income countries, states, counties or municipalities, is indispensable for charting a course for all societies.
- 4. Actionable:** The IPS aims to be a practical tool that helps leaders and practitioners in government, business, and civil society to implement policies and programs that will drive faster social progress. To achieve that goal, we measure outcomes in a granular way that focuses on specific areas that can be implemented directly.

The IPS Amazônia, like the global index, is a structure in three dimensions and 12 components. Each one of the components covers from two to five indicators (Figure 2)<sup>[4]</sup>. That structure enables classification and scoring of a municipality (or even

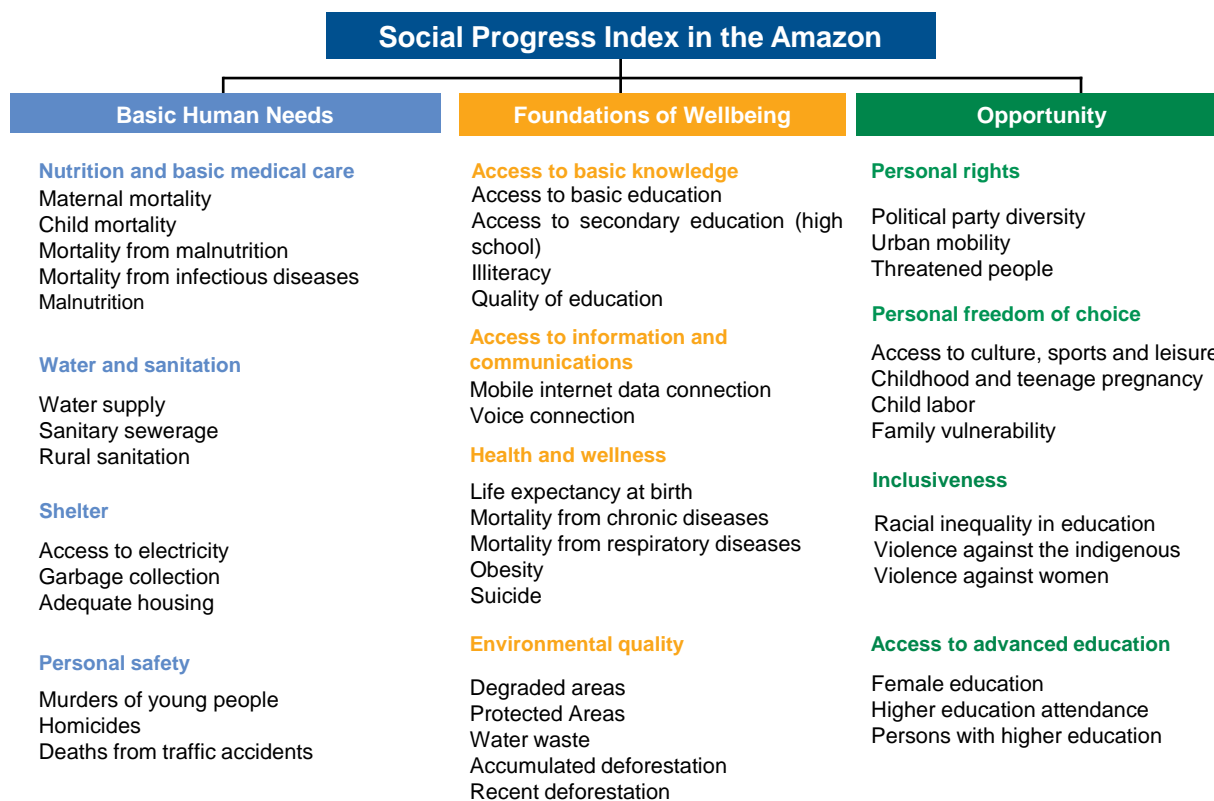

neighborhoods or communities), states, regions and countries. Furthermore, in the case of IPS Amazônia, it is possible to analyze the strong and weak points between different municipalities. Its transparency and structure allow decision-makers to establish strategic

<sup>4</sup> In IPS Amazônia there are exceptionally only two indicators in one of the components, *access to information and communications*, due to the lack of more indicators for this theme with a municipal breakdown.

# ABOUT THE SOCIAL PROGRESS INDEX IN THE AMAZON

priorities, acting according to the most relevant issues in their territories (Social Progress Imperative, 2018). To calculate it, the IPS Amazônia consists of 43 indicators from reliable sources. The index ranges from zero (worst) to 100 (best) and corresponds to a simple average of the social progress indexes of the three Dimensions (Basic Human Needs, Foundations

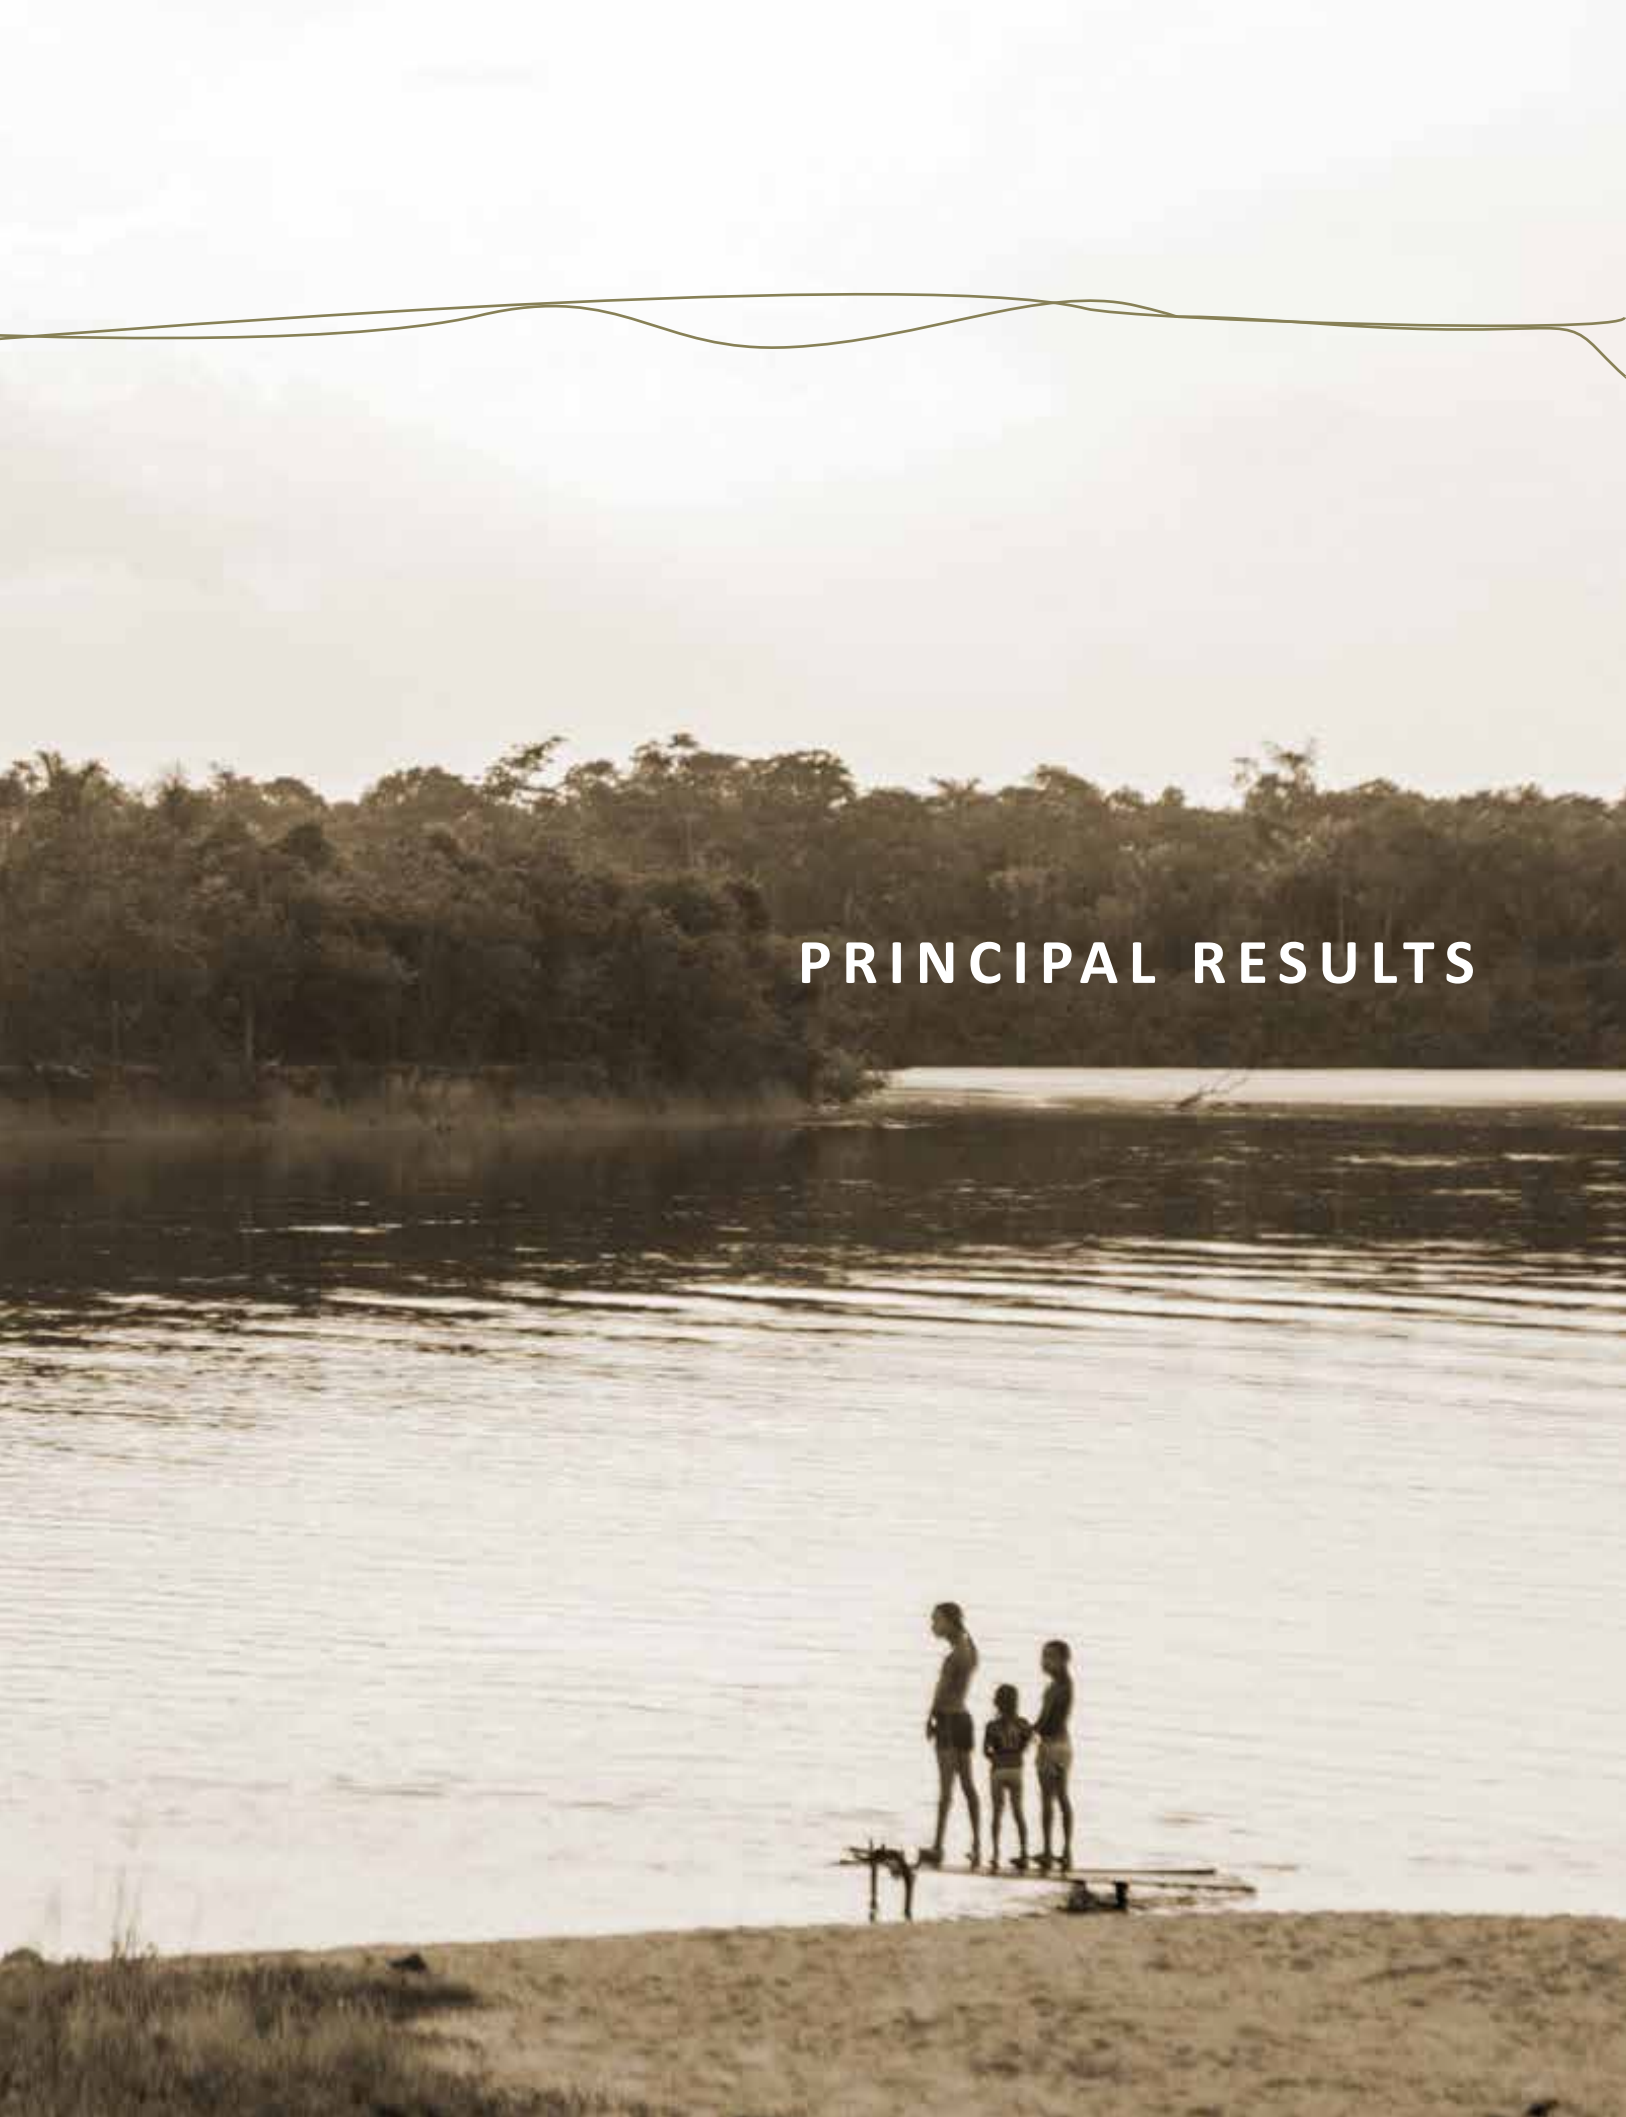

of Wellbeing and Opportunities). Likewise, the Dimensions correspond to the simple average of the Components indexes, which were generated using the Principal Component Analysis (PCA)<sup>[5]</sup> method among the indicators. In version 2018 of the IPS Amazônia, it was possible to update 25 of the 43 indicators utilized in 2014.

**Figure 2.** Structure of IPS Amazônia (dimensions, components and indicators)<sup>[6]</sup>.

<sup>5</sup> The Kaiser Meyer-Olkin (KMO) and Cronbach's alpha analyses were used to verify the validity and reliability of the PCA for all of the components, as established in the SPI methodology SPI (SPI, 2014; SPI, 2018, entre outros). See details in Appendix 2 and in Santos et al. (2014).

<sup>6</sup> For more details regarding the indicators that make up the SPI, see Appendix 2.

A sepia-toned photograph of a riverbank. In the background, a dense forest of trees lines the shore. The middle ground is dominated by a wide river with gentle ripples. In the foreground, three people are standing on a small, simple wooden platform or dock that extends into the water. The overall mood is quiet and natural.

## PRINCIPAL RESULTS

## OVERALL SPI FOR THE AMAZON

With an SPI equal to 56.52 in 2018, the Amazon remained below the national average (67.18) and even recorded a slight reduction in comparison to the IPS Amazônia 2014 (57.31) (Table 1). That drop in performance did not affect only the Amazon region, but the rest of the country as well. According to the global 2018 SPI ranking (Social Progress Imperative, 2018b), Brazil, which occupied the 46th position in 2014, dropped to 49th in 2018 among 146 countries, behind neighboring countries such as Argentina, Uruguay and Chile (Social Progress Imperative, 2014).

Among the dimensions in the Amazon, Dimension 2 (Foundations of Wellbeing) had the best result with an average index of 62.61 in 2018. With an intermediate position, Dimension 1 (Basic Human Needs) was the only one presenting a slight improvement over the last four years: reaching 59.21 compared to 58.75 in 2014. As for Dimension 3 (Opportunities), it again obtained the worst performance, with an index of only 47.75. This

dimension is the one with the higher disparity between the Amazon and the rest of the country, demonstrating precariousness in *access to advanced education, personal rights, personal freedom and choice, inclusiveness*.

The states of Mato Grosso (59.13), Rondônia (58.51) and Tocantins (57.44) presented the best average indexes in the IPS Amazônia 2018. However, those states saw a sharper social performance drop in 2018 when compared with 2014 results of the others. Acre (54.18), Maranhão (55.02), Pará (55.57) and Roraima (54.84) states achieved a slight improvement in their respective indices in 2018, considered stable in relation to 2014. The indexes of Amazonas (54.92) and Amapá (56.80) states decreased (Table 2). Throughout the region, no state obtained an IPS Amazônia or Dimensions index higher than the national averages. Besides that disparity, one can observe that there is high variation between the maximum and minimum SPI values among the municipalities of each state (Figure 3).

**Table 1.** IPS Amazônia 2018 results.

## OVERALL SPI FOR THE AMAZON

Table 3. Profile of the five SPI groups in Amazon municipalities.

	SPI groups in Amazon					Amazon
	1° (dark green)	2° (light green)	3° (yellow)	4° (orange)	5° (red)	
Number of the municipalities	25	159	281	250	57	772
Municipalities area (millions of km <sup>2</sup> )	0.09	0.93	1.18	1.97	0.86	5.04
Population (millions of inhabitants)	6.51	6.98	6.58	6.21	1.21	27.49
IPS Amazônia 2018	64.64	60.96	57.31	53.58	49.63	56.52
Dimension 1. Basic Human Needs	71.71	65.27	59.92	55.65	49.00	59.21
Dimension 2. Foundations of Wellbeing	69.28	67.14	63.90	59.11	56.1	62.61
Dimension 3. Opportunity	52.94	50.47	48.11	45.98	43.80	47.75
GDP at current prices (billions R\$ in 2016)	182.95	173.02	99.18	70.43	11.75	498.93
Per capita income (R\$/year in 2010)	8,301.07	5,956.29	4,265.67	3,412.82	2,727.66	4,354.81

The second group consists of 159 municipalities with an average SPI equal to 60.96 (light green on the map). Those municipalities total almost 19% of the territory, hold a population of around 7 million inhabitants (25%) and contribute 32% of the regional GDP. The capitals Macapá (AP), Rio Branco (AC) and Porto Velho (RO) are in this group.

The third group encompasses 281 municipalities (yellow on the map) with an average SPI of 57.31. Those municipalities hold 6.6 million inhabitants (24%), occupy 24% of the territory and represent 19%

of the region's GDP. Over the last four years, this has incorporated the highest number of municipalities, since it had 194 in 2014. This group includes municipalities that did not achieve an improvement in social progress, despite good economic performance.

In the fourth group 250 municipalities have critical levels of social progress with an average SPI of only 53.58 (orange on the map). Those municipalities total 39% of the territory, 23% of the total population and account for 13% of the Amazon GDP. Among the municipalities with critical SPI are Novo Progresso

## IPS AMAZÔNIA OF MUNICIPALITIES

(PA), Divinópolis do Tocantins (TO), Oiapoque (AP), Coari (AM) and Altamira (PA).

Finally, the fifth group (red on the map) corresponds to the 57 municipalities with the lowest levels of social progress in the Amazon, with an average SPI equal to 49.63. Those municipalities hold 1.2 million inhabitants (5%), account for only 2%

of the GDP and occupy 17% of the territory. The states of Maranhão and Pará have the highest number of municipalities in this group (37% and 19%, respectively). The worst IPS Amazônia 2018 results are in Jordão (AC), Lábrea (AM), Alto Alegre (RR), Bom Jesus do Araguaia (MT) and Lagoa Grande do Maranhão (MA).

## PRINCIPAL RESULTS

# IPS AMAZÔNIA OF MUNICIPALITIES

The Amazon municipalities fall into five groups according to their results in the IPS Amazônia 2018 (Figure 4 and Table 3). In the first group are 25 municipalities with the best indices (dark green on the map), where the average SPI is 64.64. They cover 22% of the region's territory (IBGE, 2017), have a population of 6.5 million inhabitants (24% of the Amazon population) and account for 34% of the region's GDP (IBGE, 2018a; IBGE, 2018b). Six capitals

are in this group: Cuiabá (MT), Palmas (TO), Manaus (AM), Belém (PA), São Luís (MA) and Boa Vista (RR). Although those municipalities had the best results in the region, their performance was lower than the Brazilian average except for Cuiabá. In 2014, 87 municipalities represented that group as opposed to only 25 municipalities in 2018. Therefore, more than two-thirds of municipalities in that group had a reduction in social progress over the last four years (Appendix 1).

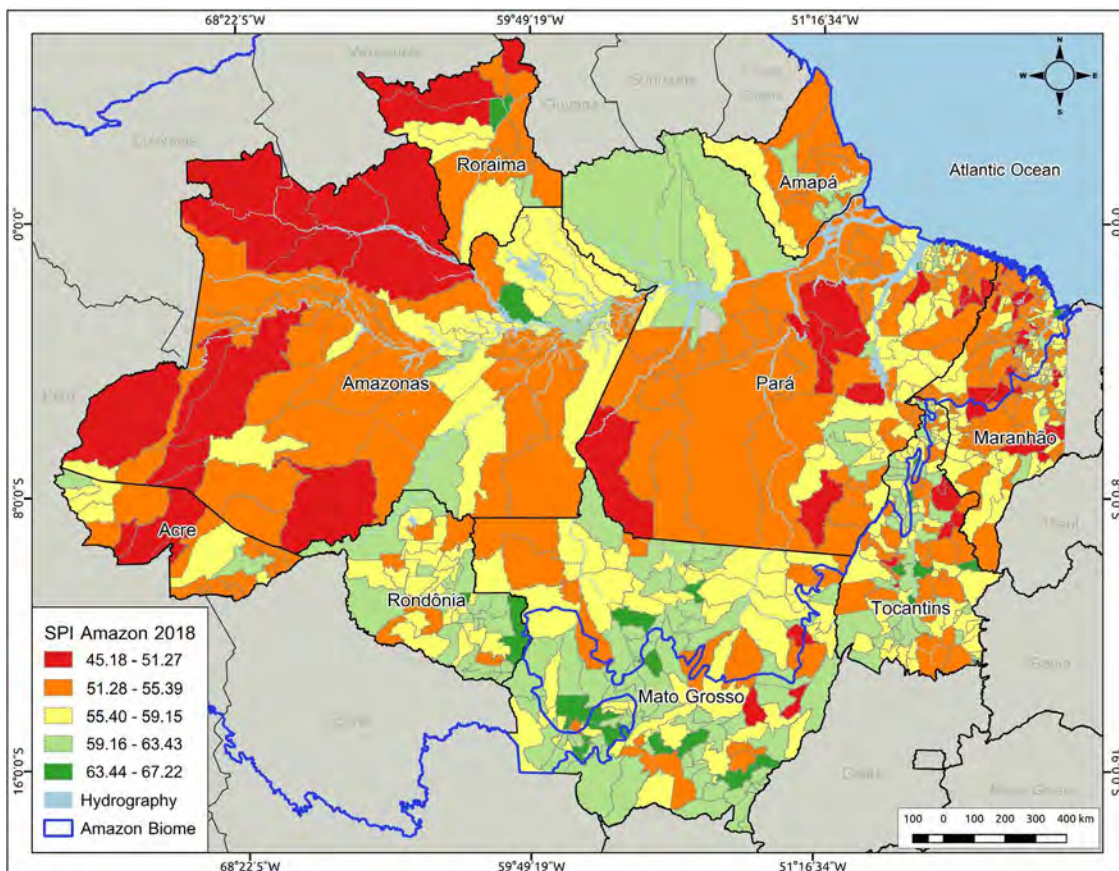

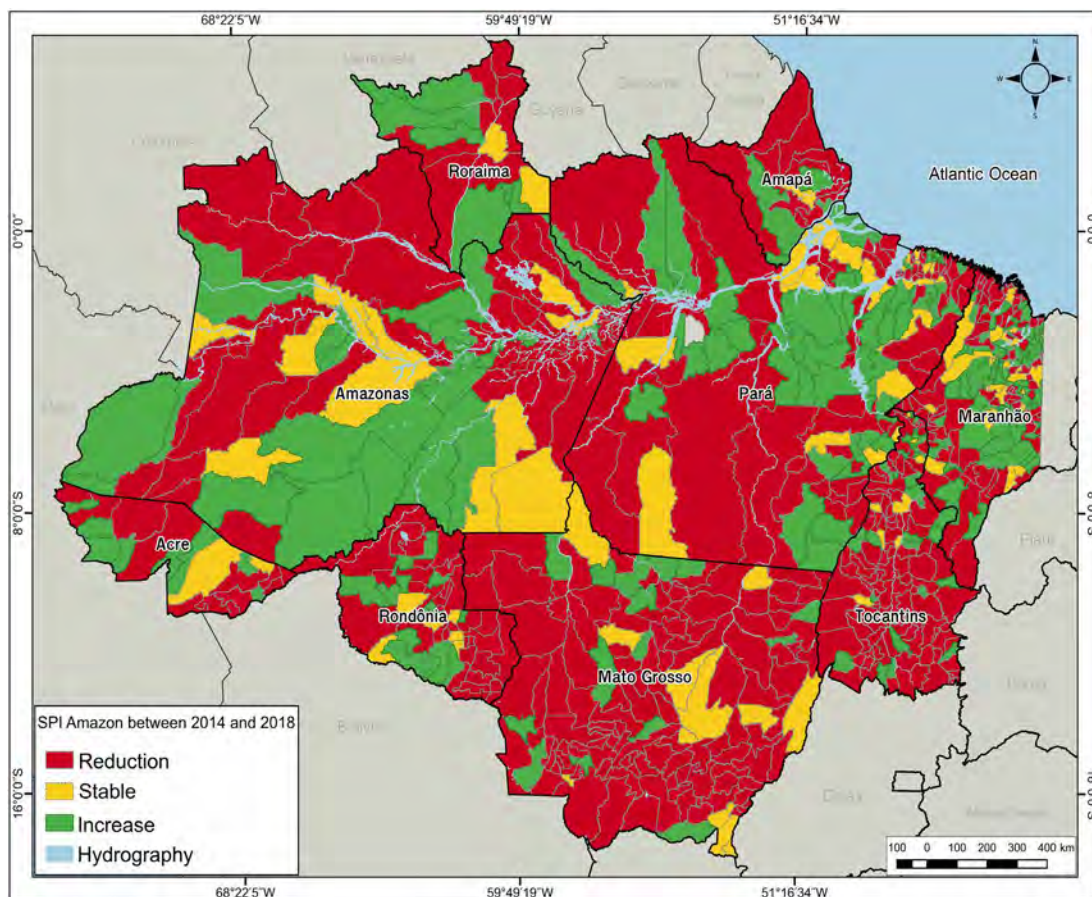

Figure 4. SPI in municipalities in the Amazon.

# IPS AMAZÔNIA OF MUNICIPALITIES

**Box 1 .** Advances and setbacks of IPS Amazônia 2018 in the municipalities.

Among the 772 Amazonian municipalities evaluated, the majority (59%) saw their SPI reduced in comparison to 2014. Important ones suffered such a reduction, for example, such as the nine Amazon capitals: Belém (PA), Boa Vista (RR), Cuiabá (MT), Macapá (AP), Manaus (AM), Palmas (TO), Porto Velho (RO), Rio Branco (AC) and São Luís (MA). On the other hand, only 30% dos municipalities increased their SPI, including Tailândia (PA), Bacabal (MA), Parauapebas (PA), Terra Santa (PA) and Faro (PA). Finally, the SPI remained stable<sup>7</sup> in 2018 for 11% of municipalities, such as in Ourém (PA), Novo Progresso (PA), Paranatinga (MT), Coari (AM), Planalto da Serra (MT) and Centro Novo do Maranhão (MA) (Figure 5).

**Figure 5.** Variation of the SPI from 2014 to 2018 in municipalities in the Amazon.

<sup>7</sup> A municipality with “stable” SPI is considered to be one with an increase from 0 to 1 point from 2014 to 2018.

# IPS AMAZÔNIA OF MUNICIPALITIES

## Strong and weak points of Amazon municipalities (scorecards)

The social progress measured by the SPI, its three dimensions, 12 components and 43 indicators may be evaluated individually for the 772 municipalities using the scorecards (Figure 6) that

are available at the sites [www.ipsamazonia.org.br](http://www.ipsamazonia.org.br) and [www.progressosocial.org.br](http://www.progressosocial.org.br). The scorecards present the complete results and the classification of each municipality in the regional ranking. The results receive a green (good result), yellow (neutral) or red (weak) card in relation to other municipalities in the same range of annual per capita income, as seen in the example below.

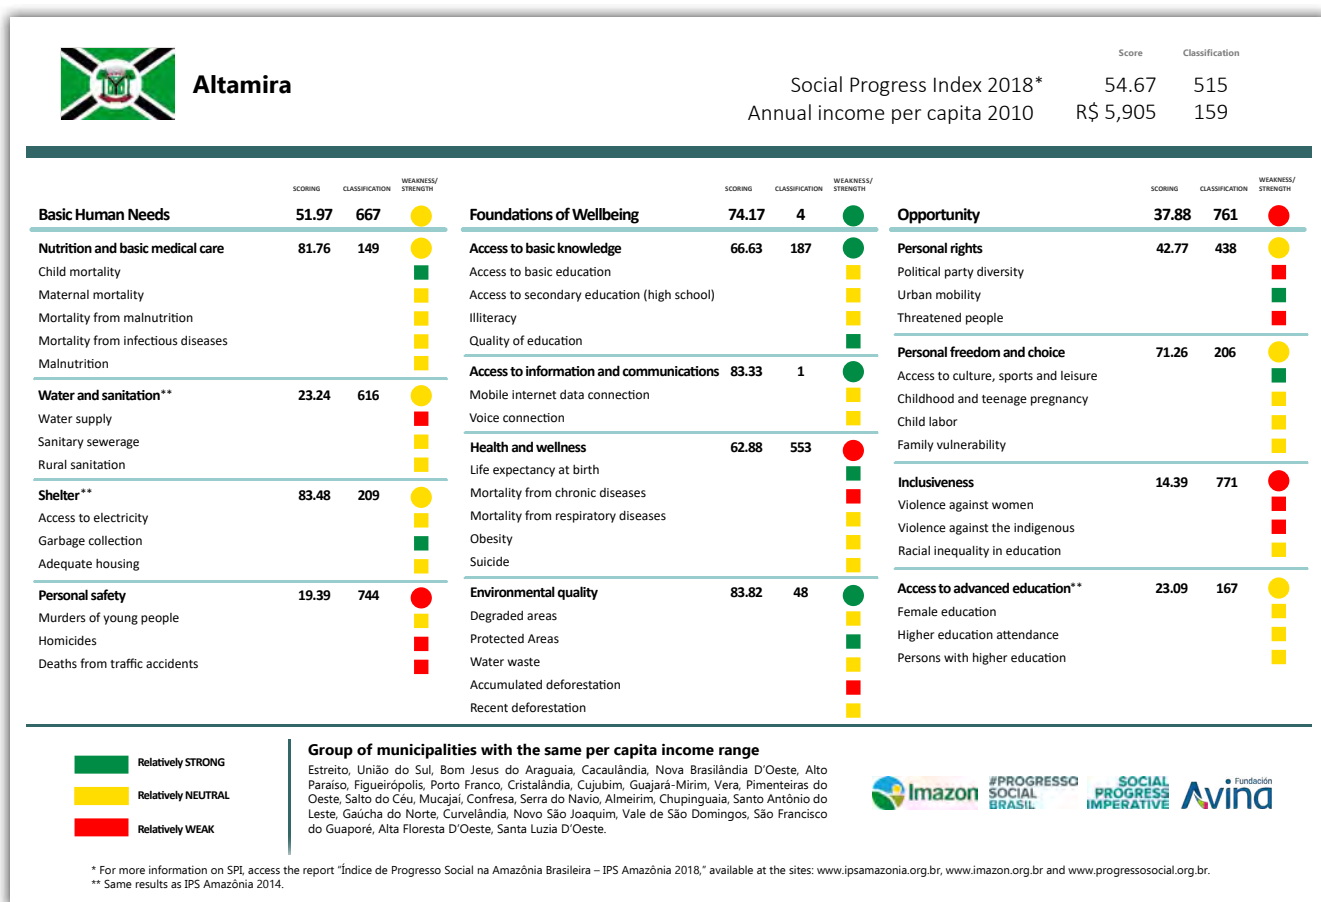

Figure 6. Scorecard for Altamira (Pará State).

## SOCIAL PROGRESS AND ECONOMIC DEVELOPMENT

One of the objectives of SPI is to better understand the relationship between social progress and economic development (Social Progress Imperative, 2014). As with the 2014 report, the IPS Amazônia 2018 presents a positive correlation with per capita income (59%) in municipalities in the region. However, economic performance alone does not fully explain the social progress of a municipality, since the relation between SPI and per capita income is not linear. There is a major variation between the SPI in municipalities with the same range of per capita income (Figure 7).

Some municipalities with very low per capita income present a relatively high SPI in relation to other municipalities in the same income bracket. For example, Ipueiras (TO), Porto Rico do Maranhão (MA)

and Santa Cruz do Arari (PA) are among the best 40 IPS Amazônia in the regional ranking, even presenting a very low per capita income in comparison with the capitals.

On the other hand, various municipalities with income above the regional average presented SPIs at lower levels in 2018, among them: Bom Jesus do Araguaia (MT), Cumaru do Norte (PA), Lagoa da Confusão (TO), Oliveira de Fátima (TO), Nova Nazaré (MT). Thus, although they are correlated, high economic development does not necessarily lead to social progress for an Amazon municipality. At the IPS Amazônia site, it is possible to verify the position of every municipalities with regard to the SPI and the respective per capita income brackets.

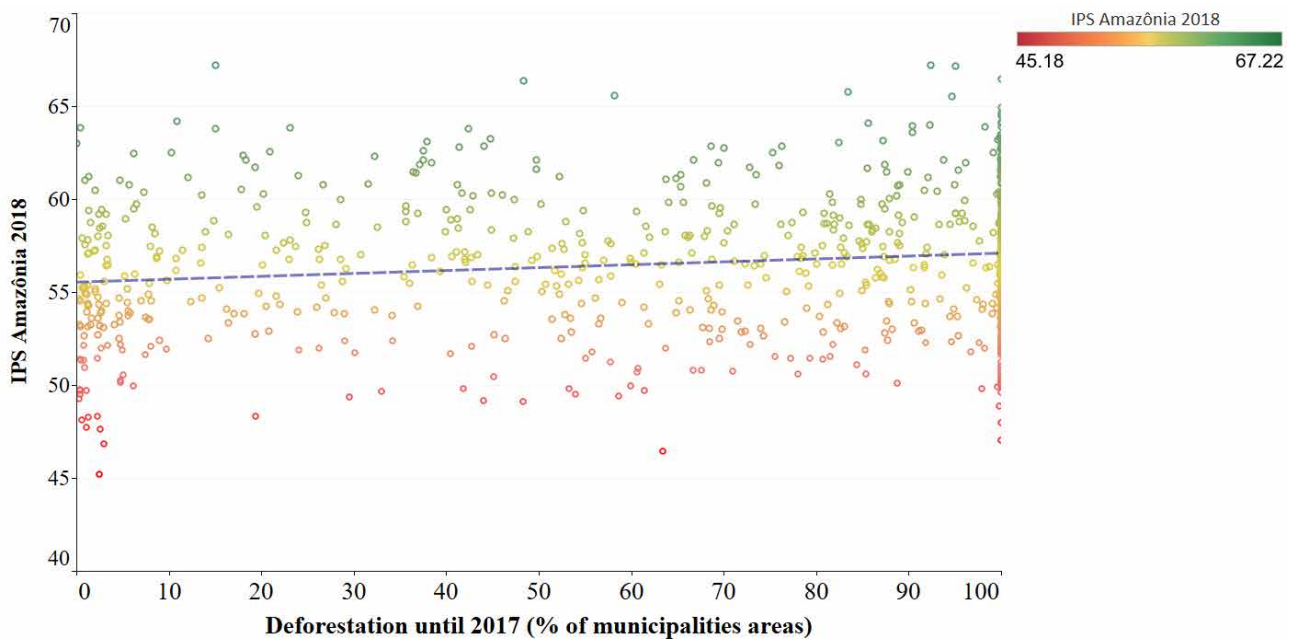

**Figure 7.** The relation between SPI and per capita income 2010 (UNDP, 2013) in Amazon municipalities.

## SOCIAL PROGRESS AND DEFORESTATION

The Amazon has already lost around 20% of its forest (789 thousand square kilometers), the equivalent to an area larger than the Southern Brazil region or three times the São Paulo state area. From 2014 to 2018, the years for measuring IPS Amazônia, 34 thousand square kilometers of forest area suffered deforestation in the Amazon (Inpe, 2018). In 2017, Greenhouse Gas Emissions (GHG) due to deforestation represented 30% of the total emitted by Brazil (SEEG, 2018). After almost a decade of falling rates, deforestation again rose in the region beginning in 2013, reaching 7.9 thousand square kilometers in 2018 (Inpe, 2018).

Deforestation is undesirable and unnecessary in the Amazon. Unnecessary because the deforested areas in the region that are abandoned or degraded are already sufficient for guaranteeing an increase in agricultural and ranching production in the future. Undesirable because deforestation represents enormous environmental and social costs and low economic return for regional development. Our analyses indicate that there is no correlation between deforestation and social progress measured by the SPI (Pearson 0,02) (Figure 8). On the contrary, deforestation leads to social, environmental and economic losses at all scales.

**Figure 8.** The relation between SPI and deforestation (Inpe, 2018) in Amazonian municipalities.

# THE DIMENSIONS OF IPS AMAZÔNIA

## DIMENSION 1

### (Basic Human Needs)

Dimension 1 of SPI uses four components to measure if the more basic needs of a population are being guaranteed: water and sanitation, housing, nutrition and basic medical care and personal security (Figure 9). That dimension (59.21) was the only one that presented a slight improvement in comparison to 2014 (58.75).

One component of Dimension 1, *nutrition and basic medical care*, evolved between 2014 and 2018 from 72.46 to 76.73 (Table 4). However, that component still shows grave and persistent problems in the region: malnutrition,

child mortality, maternal mortality and mortality from infectious diseases. As for the components *water and sanitation* and *shelter*, they have the same average indices as 2014 (35.35 and 72.48, respectively) because of the absence of updated data. These two components show the level of access of the region's population to basic services such as water supply, appropriate sewerage disposal (general network or septic tank), garbage collection, electricity and housing. Finally, the average index for the personal security component worsened from 2014 to 2018, falling from 54.71 to 52.28. In reality, the homicide rate in the Amazon increased from 32 to 42 homicides per 100 thousand inhabitants in 2009 and 2016, respectively (Figure 10).

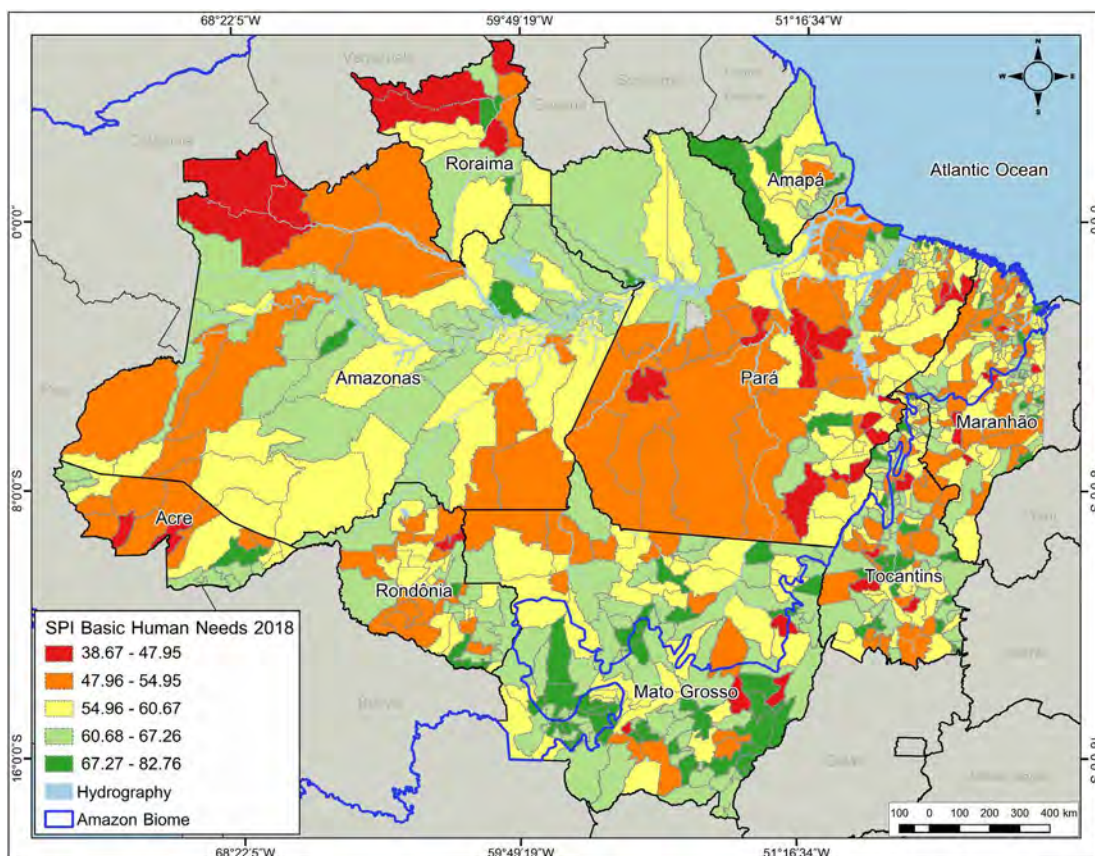

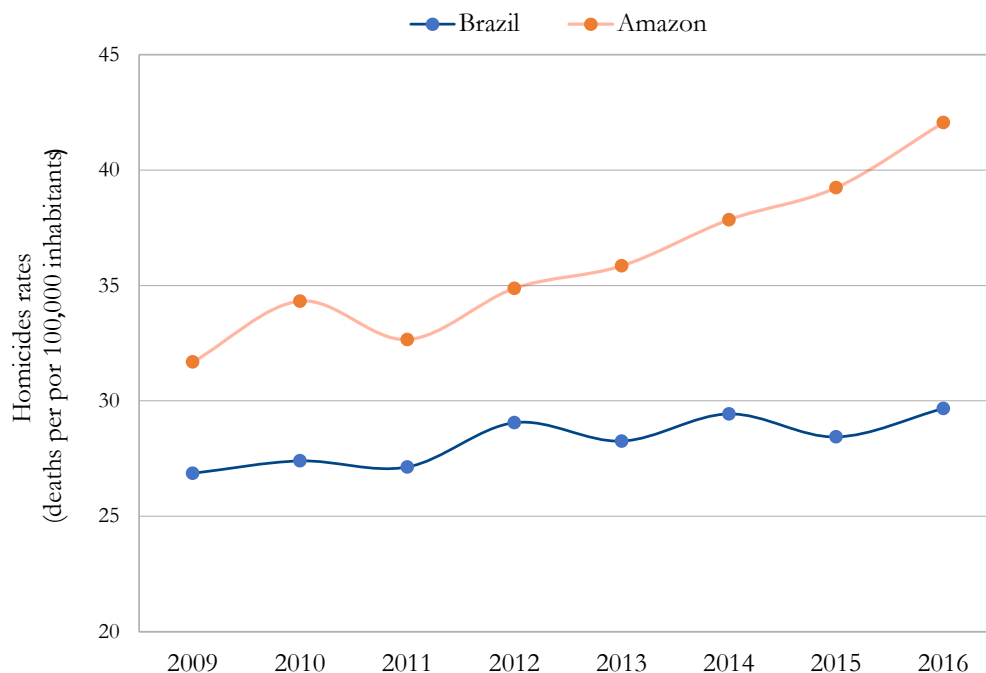

Figure 9. Dimension 1 (Basic Human Needs) in Amazonia municipalities.

# THE DIMENSIONS OF IPS AMAZÔNIA

**Table 4.** SPI of components of the Basic Human Needs dimension of the IPS Amazônia in 2014 and 2018.

States	Nutrition and basic medical care		Water and sanitation	Shelter	Personal safety	
	2014	2018			2014	2018
Acre	70.66	76.37	28.42	68.95	48.11	54.77
Amazonas	73.89	78.01	30.98	67.49	60.24	63.73

<b>Amazon Region</b>	<b>72.46</b>	<b>76.73</b>	<b>35.35</b>	<b>72.48</b>	<b>54.72</b>	<b>52.28</b>

**Figure 10.** Homicide rate (deaths per 100 thousand inhabitants) in the Amazon and Brazil from 2009 to 2016 (BRASIL, 2018).

# THE DIMENSIONS OF IPS AMAZÔNIA

## DIMENSION 2 (Foundations of Wellbeing)

Dimension 2 of the SPI shows whether or not the Amazon municipalities have the necessary structure for guaranteeing social wellbeing (Figure 11). It has four essential components: access to basic knowledge, access to information

and communications, health and wellness and environmental quality. This dimension has the best result (62.52) in IPS Amazônia 2018.

Among the components of this dimension, the average index of *access to information and communications* improved slightly from 2014 to 2018, going from 53.35 to 54.24. However, this component has the worst result in Dimension 2 and highest disparity in relation to the

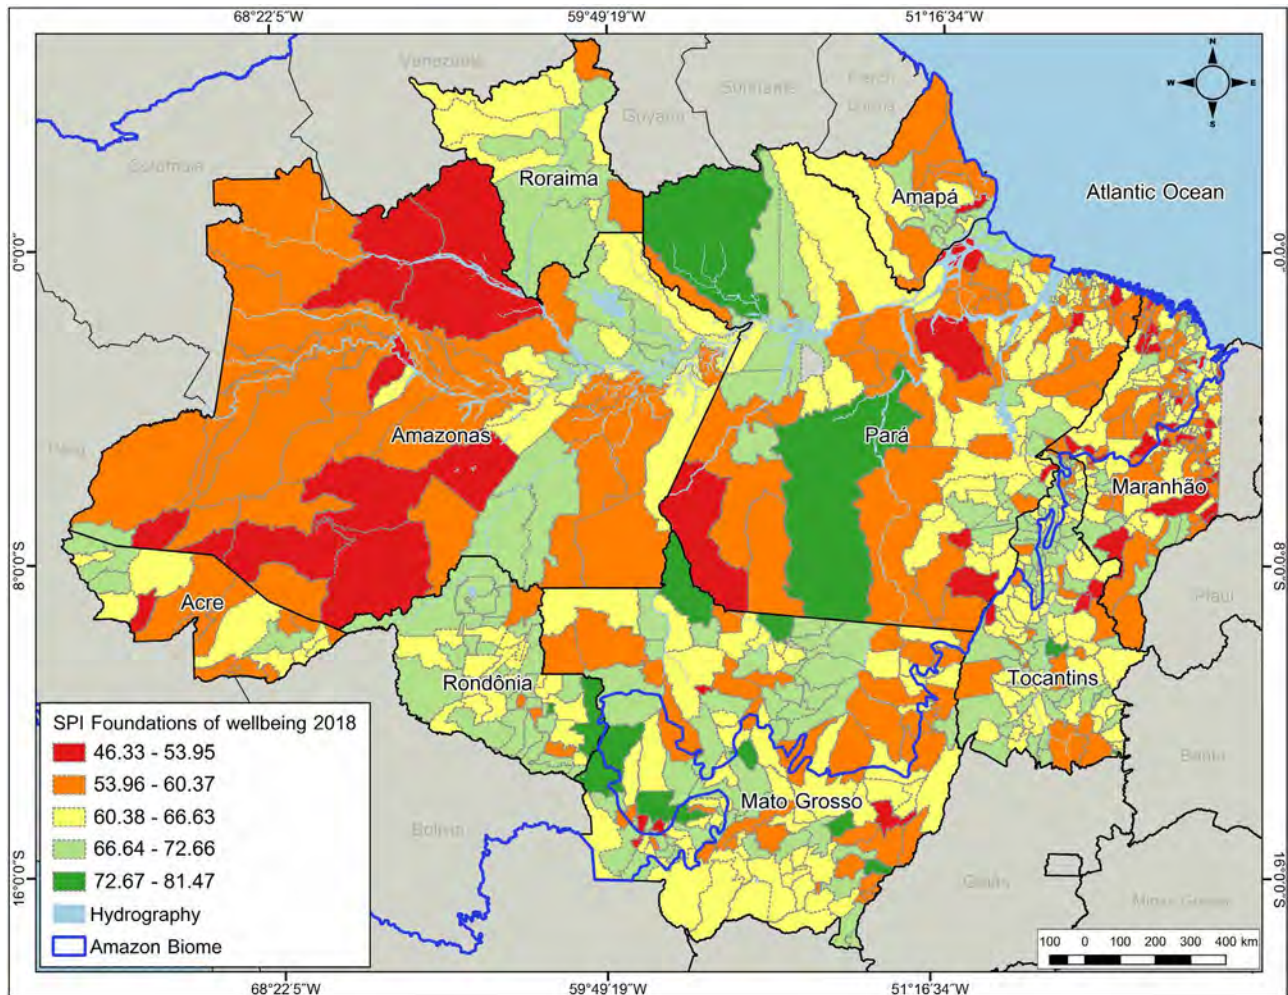

Figure 11. Dimension 2 (Foundations for Wellbeing) in Amazon municipalities.

# THE DIMENSIONS OF IPS AMAZÔNIA

national average (66.67). On the other hand, the indexes for the components *environmental quality* and *health and wellness* worsened from 2014 to 2018 (Table 5). The first fell from 74.85 to 69.29, since it was greatly influenced by the increase in deforestation and forest degradation

during the period, while the second fell from 70.57 to 65.66, the result of worsening rates of mortality due to chronic diseases, respiratory diseases and suicides utilized in this component (Table 6).

**Table 5.** SPI of the components of the dimension Foundations of Wellbeing of the IPS Amazônia in 2014 and 2018.

States	Access to basic knowledge		Access to information and communications		Health and wellness		Environment quality	
	2014	2018	2014	2018	2014	2018	2014	2018

	2016	4.63	5.55

# THE DIMENSIONS OF IPS AMAZÔNIA

## DIMENSION 3

### (Opportunity)

Dimension 3 of SPI estimates the level of access to rights and liberties, the capacity of citizens for making personal decisions and the level of prejudices or hostility that keep them from achieving

full potential in society. This dimension has four components: *personal rights*, *personal freedom and choice*, *inclusiveness* and *access to advanced education*. As it was in IPS Amazônia 2014, this is the dimension with the worst result in the Amazon, with an average index of only 47.75, while in rest of Brazil presented an index of 59.20 (Figure 12).

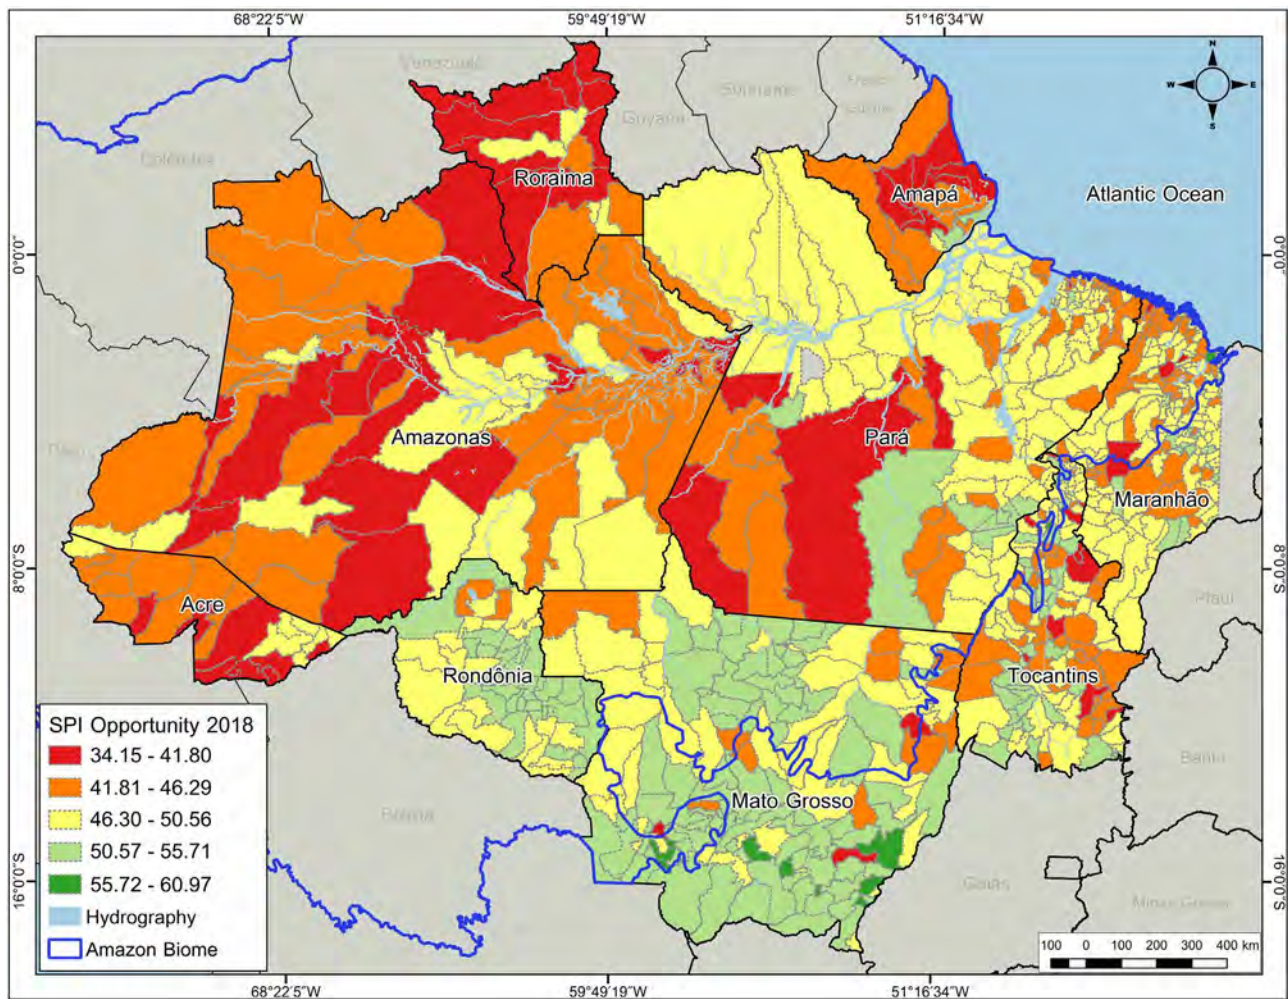

Figure 12. Dimension 3 (*Opportunity*) in Amazonia municipalities.

## THE DIMENSIONS OF IPS AMAZÔNIA

The component *access to higher education* is the worst among all of the SPI components, with a result of only 19.10 (the national average is 33.76). As with the *water and sanitation* and *shelter* components, this component has results equal 2014, since the update of its indicators did not occur in recent years according to official sources. The component *inclusiveness* in 2018 is the only one with an average (63.19) slightly better than Brazil (61.74). However, it has worse results in comparison to 2014.

As for the component *personal rights*, it worsened slightly from 2014 to 2018, falling from 45.22 to 44.15. This component includes indicators for urban mobility, political party diversity and threatened persons.

*Personal freedom and choice* remained stable: from 64.41 to 64.81. The indicators of this component are access to culture, sports and leisure; childhood and teen pregnancy; child labor; and family vulnerability (Table 7).

**Table 7.** SPI for components of the opportunity dimension of the IPS Amazônia in 2014 and 2018.

States	Personal rights		Personal freedom and choice		Inclusiveness		Access to advanced education
	2014	2018	2014	2018	2014	2018	
Acre	41.53	41.37	61.88	61.25	61.22	52.26	18.00
Amazonas	39.59	40.27	57.37	57.01	63.53	63.28	16.08
Amapá	40.47	39.68	58.22	58.39	70.32	54.16	21.42

A photograph of a person in a small, narrow boat on a body of water. The person is standing and appears to be using a long pole to navigate. The background is a dense, green forested hillside. The sky is overcast and grey. A large tree branch is visible in the upper left corner. A thin, dark line, possibly a wire or cable, runs horizontally across the upper portion of the image.

## CONCLUSION

# CONCLUSION

Four years have passed since the launch of the first edition of the IPS Amazônia in 2014; however, the results from 2018 indicate that the region continues to have low levels of social progress, clearly incompatible with its natural wealth and strategic importance for Brazil. In fact, the Amazon faces a severe crisis of social progress with an SPI (56.52) well below the SPI for Brazil (67.18). Of the 772 municipalities, only Cuiabá (MT) has an SPI slightly higher than the average for Brazil. That demonstrates that the pattern of development experienced in the Amazon so far has not been sufficient to improve the quality of life for its inhabitants in comparison with the rest of Brazil. The majority of the population subsists with a low quality of life, while at the same time the exuberant forest is replaced by deforested landscapes, chaotic cities and affected by growing violence, precarious sanitation, education of low quality and other ills.

The Amazon is living in a perverse combination of low social progress, high environmental degradation and sub-economic development. In other words, we are losing one of our greatest treasures in exchange for nothing. The region represents almost 60% of Brazilian territory but contributes less than 9% of the Brazilian GDP. Furthermore, it emits around 41% of the GHGs in Brazil. That high level of emissions is mostly the result of deforestation. The economy, for its part, involves low added value and is linked to illegality and informality. It is thus, the worst of worlds: massive environmental degradation, precarious and chaotic social situation and little generation of wealth.

There is no single solution for resolving the complex issues in the Amazon, but any strategy to be pursued must take three factors into account. First, we have already deforested all the land that we need for developing agriculture, ranching, mining

and infrastructure. It is therefore entirely possible to generate wealth in the Amazon and supply work and benefits to its approximately 27 million inhabitants without deforesting new areas. Achieving that goal depends primarily on developing and utilizing new technologies and existing techniques to make better use of the land already deforested. It is time to seek a more intelligent model for economic growth that does not depend on destroying the forest. Second, the economic and strategic value of the forest is immense and continues to grow, as does our increasingly expanding understanding of that intrinsic value, even though we do not not acknowledge the biodiversity in the region properly. Third, Amazon needs to attract quality investments, win markets that consume only products with higher added value from areas free of deforestation.

In fact, Brazilians and worldwide consumers want to buy products that are “free of deforestation”. There is enormous pressure coming from the markets to eliminate products coming from deforested areas. For example, the Consumer Goods Forum is an initiative of some of the largest global companies that have committed to zero deforestation 2020. In other words, from that date on, those companies will cease to buy any beef, soy, palm oil, timber or paper that come from recently deforested areas.

We believe that the best way to achieve social progress in the Amazon is to seek the end of deforestation, dynamize the economy based on sustainable use of natural resources, invest in infrastructure to improve quality of life and guarantee better opportunities for the region’s 27 million inhabitants. The IPS Amazônia is a useful tool for guiding public policies and other actions to benefit the Amazon population.

<sup>8</sup> Caveat: the colors (dark green, light green, yellow, Orange and red) used in the table to indicate the group in the IPS Amazônia to which the municipality belongs use the SPI scoring as their basis. That does not mean that the municipality also occupies that same group in the three dimensions of the SPI. In other words, a municipality may be classified as dark green (group 1) in the SPI, but have different colors for the dimensions (for example, group 2 or 3), components and indicators (expressed in the scorecards).

## APPENDIX 2

### METHODOLOGY FOR CALCULATING THE IPS AMAZÔNIA

The SPI calculation follows the methodology prepared by the Social Progress Imperative, detailed in the report *IPS Amazônia 2014* (Santos et al., 2014). The 12 components of the structure of the index contain 43 indicators selected by Imazon in 2014, included in the three dimensions. The SPI corresponds to the simple average of the values for social progress in those three dimensions. For its part, each one of them follows the average of the indices obtained for the four components that each one has. The PCA between the indicators resulted in the weights to calculate the indexes for them. The following steps were necessary to enable comparability between the SPI 2014 and 2018:

- Perform the same adjustments in some indicators occurring in the SPI 2014, transforming them from the original unit to ordinal, in order to avoid having discrepant values distorting the weights in the factorial analysis of some components.
- Estimate values for indicators for some municipalities by resorting to a regression process applied at the component level. In exceptional situations, qualitative and group cutoff estimates are applied. Limiting the regression to the indicators for the components makes it possible to preserve the signal provided by the indicator to the calculation of the factorial analysis of the component.
- Other adjustments: maximum and minimum in updated indicators for the components *nutrition* and *basic medical care and personal security*; adjustments for indicator categorization of the components *access to information and communications* and *inclusiveness*.
- The Kaiser-Meyer-Olkin (KMO) and Cronbach's alpha analyses verified the validity and reliability of each component among the updated indicators. In general, the values obtained for 2018 are similar to those for 2014, except for the Cronbach's alpha of the component *nutrition and basic medical care*.
- The weights obtained in the PCA for the indicators for calculating the index in 2014 are the same for version 2018.
- The non-updated indicators derived from the IBGE 2010 Census and the Human Development Atlas of UNDP and Ipea at the municipal level were maintained. Therefore, the indices for the respective components are equal to those of the SPI 2014.
- To prepare the scorecards and analysis of the relation between SPI and economic development, the use of the per capita income indicator obtained from the IBGE 2010 Census was maintained.

# APPENDIX 3

## SOURCES AND DEFINITIONS OF INDICATORS

[NOTE: The changes in the boxes below are to provide consistency in Table style]

**Box 1.** Detailing of indicators of the dimension Basic Human Needs of the IPS Amazônia.

Dimension	Component	Indicator	Definition	Unit	Year	Website link	Source	Updated?
Basic Human Needs	Nutrition and basic medical care	Child mortality	Number of children who do not survive until the fifth year of life	Deaths per thousand live births	2010	<a href="http://is.gd/RyvvdO2">is.gd/RyvvdO2</a>	UNDP and Ipea	
		Maternal mortality	Number of women who died for any reason related to or aggravated by pregnancy, at birth or up to 42 days after the end of gestation.	Maternal deaths per 100 thousand live births	2016	Maternal deaths: <a href="http://is.gd/a98yub">is.gd/a98yub</a>		
		Mortality from infectious diseases	Mortality rate caused by various infectious diseases together (tuberculosis, HIV/AIDS, malaria, dengue, Hansen's disease, hepatitis B, hepatitis C, Chagas's disease and others).	Deaths per 100 thousand inhabitants	2016	Deaths: <a href="https://is.gd/uPFe2Q">https://is.gd/uPFe2Q</a>	Ministry of Health	
		Mortality from malnutrition	Mortality rate for population due to lack of ingesting food.	Deaths per 100 thousand inhabitants	2016	Deaths: <a href="https://is.gd/uPFe2Q">is.gd/uPFe2Q</a> Population 2016: <a href="https://is.gd/H8qlQk">https://is.gd/H8qlQk</a>		
		Malnutrition	Population of all ages below ideal weight and Body Mass Index (BMI).	% of population	2017	<a href="http://is.gd/t8P1e2">is.gd/t8P1e2</a>		
		Water supply	Population with water supply service through a general distribution network	% of population	2010	<a href="http://is.gd/F0rt1Ec">http://is.gd/F0rt1Ec</a>		
	Water and sanitation	Sanitary sewerage	Population with basic sanitation, including channeled sewage systems and septic tanks.	% of population	2010	<a href="http://is.gd/F0rt1Ec">http://is.gd/F0rt1Ec</a>		
		Rural sanitation	Difference between the percentage of rural population with water facilities and the average percentage of rural population with water facilities of the group of 30 municipalities with a similar rural population.	Difference between % of rural population with access to water	2010	<a href="http://is.gd/F0rt1Ec">http://is.gd/F0rt1Ec</a>	IBGE

## SOURCES AND DEFINITIONS OF INDICATORS

**Box 2.** Detailing of indicators of the dimension Foundations of Wellbeing of the IPS Amazônia.

Dimension	Component	Indicator	Definition	Unit	Year	Website link	Source	Updated?
Foundations of Wellbeing	Access to basic knowledge	Access to basic education	Ratio between the number of persons ages 6 to 17 enrolled in basic education and the total of that same age group multiplied by 100.	% of net attendance in basic education	2010	<a href="http://is.gd/RyvvdO2">is.gd/RyvvdO2</a>		
		Access to secondary education (high school)	Ratio between the number of persons in the age group of 15 to 17 years attending regular graded high school and the total population of that same age range multiplied by 100. Persons aged 15 to 17 attending a 4th year of high school were considered as having already concluded that level of education.	% of net attendance in secondary education	2010	<a href="http://is.gd/RyvvdO2">is.gd/RyvvdO2</a>	UNDP and Ipea	
		Illiteracy	Ratio between the population age 15 or more who cannot read or write a simple note.	% of the population age 15 or more	2010	<a href="http://is.gd/RyvvdO2">is.gd/RyvvdO2</a>		
	Access to information and communications	Quality of education	Ideb is an indicator created by the federal government to measure the quality of teaching in schools. It is calculated using the school approval rate (passing) and the average performance on tests applied by Inep.	Ideb (0-10)	2015	<a href="http://ideb.inep.gov.br/">ideb.inep.gov.br/</a>	Inep	
		Mobile data internet connection	Connection rate: evaluates to what point the consumer can access the data network internet via mobile phone.	% of connections made successfully. Scored on a scale of 0-5. 0 = 2% 1 = 2% - 79% 2 = 80% - 96% 3 = 96% - 98% 4 = 98% - 99% 5 = 99% - 100	2017	<a href="http://is.gd/A1J5TG">is.gd/A1J5TG</a>		
		Voice connection	Voice connection rate: evaluates to what point the consumer can access the voice network to make calls on a mobile phone.	% of connections made successfully. Scored on a scale of 0-5. 0 = 2% 1 = 2% - 79% 2 = 80% - 96% 3 = 96% - 98% 4 = 98% - 99% 5 = 99% - 100	2017	<a href="http://is.gd/A1J5TG">is.gd/A1J5TG</a>	Anatel
