

System for Monitoring Timber Harvesting (Simex)

Mapping logging in AMAPÁ STATE

August 2022 to July 2023

Between August 2022 and July 2023, 351 hectares of logging were detected in Amapá. The authorized area represented 100% of the total mapped. Around 97% of the logging was mapped within a Conservation Unit under a management plan.

ASSESSMENT OF LEGALITY

The data used to check the legality of management plans in the state during the period under review was obtained from the Amapá State Secretariat for the Environment - Sema/AP. The Simex Network assessed the existence of authorizations for the logged areas detected, classifying them as authorized and unauthorized. The environmental agency reviewed and validated the results presented here.

CLOUD COVER

Due to the climatic conditions in the region (with high cloud cover for most of the year), Simex was unable to fully assess the area of vegetation cover in the state between August 2021 and July 2022. Therefore, there may be other areas of logging that were not mapped.
